**MULTI-SPEED GEARBOX**

This application is a National Stage completion of PCT/EP2013/055071 filed Mar. 13, 2013, which claims priority from German patent application serial no. 10 2012 206 817.1 filed Apr. 25, 2012.

**FIELD OF THE INVENTION**

The present invention relates to a multi-stage transmission of a planetary design, in particular an automatic transmission for a motor vehicle.

**BACKGROUND OF THE INVENTION**

According to the prior art, automatic transmissions, particularly for motor vehicles, comprise planetary gear sets that are shifted using friction elements or shift elements such as clutches and brakes, and typically are connected to a start-up element, such as a hydrodynamic torque converter or a fluid coupling, that is subject to a slip effect and is provided optionally with a lock-up clutch.

Such an automatic transmission is known, for example, from DE 199 12 480 B4 by the applicant. It comprises three single-carrier planetary gear sets, as well as three brakes and two clutches for shifting six forward gears and one reverse gear, an input shaft and an output shaft, wherein the carrier for the first planetary gear set is permanently connected to the ring gear of the second planetary gear set, and the carrier for the second planetary gear set is permanently connected to the ring gear of the third planetary gear set, and the input shaft is directly connected to the sun gear of the second planetary gear set.

Furthermore, in the known transmission, the input shaft is connectable, by means of the first clutch, to the sun gear of the first planetary gear set, and, by means of the second clutch, to the carrier of the first planetary set, wherein the sun gear of the first planetary gear set is connectable, by means of the first brake, to a housing of the transmission, and the carrier of the first planetary gear set is connectable, by means of the second brake, to the housing of the transmission, wherein the sun gear of the third planetary gear set is connectable, by means of the third brake, to the housing of the transmission. The input shaft of the transmission is permanently connected to the carrier for the third planetary gear set and the ring gear of the first planetary gear set.

Furthermore, a nine-speed multi-stage transmission is known from DE 29 36 969 A1; it comprises eight shift elements and four planetary gear sets, wherein one planetary gear set serves as a front-mounted transmission and the main gearing includes a Simpson set and a further planetary gear set serving as a reverse gearing.

Further multi-stage transmissions are known, for example, from the applicant's DE 10 2005 010 210 A1 and DE 10 2006 006 637 A1.

Automatically shiftable vehicle transmissions of a planetary design are already generally described numerous times in the prior art and are continually undergoing further development and improvement. These transmissions should have a relatively simple design, in particular requiring a small number of shift elements, and minimize the need for double shifting, i.e., engaging and/or disengaging two shift elements, when sequential shifting is performed, thereby ensuring that only one shift element is ever switched when shifting is performed in defined groups of gears.

The applicant's document, DE 10 2008 000 428 A1 discloses a multi-stage transmission of a planetary design that

2

includes an input shaft and an output shaft, which are disposed in a housing. In the known transmissions, at least four planetary gear sets, referred to in the following as the first, second, third and fourth planetary gear sets, at least eight rotatable shafts, referred to in the following as the drive shaft, output shaft, third, fourth, fifth, sixth, seventh and eighth shafts, as well as at least six shift elements, comprising brakes and clutches, are provided, the selective engagement of which produces different transmission ratios between the input drive and the output drive, so that preferably nine forward gears and one reverse gear can be implemented,

The first and second planetary gear sets, which are preferably designed as minus planetary gear sets, thus having a negative stationary transmission ratio, form a shiftable front-mounted gear set, wherein the third and fourth planetary gear sets form a main gear set.

In the known multistage transmission, the carriers of the first and second planetary gear sets are coupled together, via the fourth shaft, which is connected to an element of the main gear set, the ring gear of the first planetary gear set is coupled to the sun gear of the second planetary gear set, via the eighth shaft, which is detachably connectable to the drive shaft via the first clutch, and the sun gear of the first planetary gear set can be coupled to a housing of the transmission by means of the third shaft, via a first brake, and is detachably connectable to the drive shaft, via a second clutch, wherein the ring gear of the second planetary gear set can be coupled to a housing of the transmission by means of the fifth shaft, via a second brake. In addition, the seventh shaft is permanently connected to at least one element of the main gear set, and can be coupled to the housing of the transmission, via a third brake, and the sixth shaft is permanently connected to at least one further element of the main gear set and is detachably connectable to the drive shaft, via a third clutch; the output shaft is permanently connected at least to one further element of the main gear set.

In the known transmission, the fourth shaft is preferably permanently connected to the ring gear of the third planetary gear set, the sixth shaft is permanently connected to the ring gear of the fourth planetary gear set and to the carrier of the third planetary gear set, and is detachably connectable to the drive shaft, via the third clutch. Furthermore, the seventh shaft is permanently connected to the sun gears of the third and fourth planetary gear sets, and can be coupled to a housing of the transmission, via the third brake. In this case, the output drive is produced, via the output shaft, that is permanently connected to the carrier of the fourth planetary gear set. Furthermore, the third and fourth planetary gear sets can be combined or reduced to a Ravigneaux set having a common carrier and a common ring gear.

According to the prior art, the shift elements of multi-stage transmission thus designed, which are usually designed as lamellar clutches or brakes, are actuated hydraulically, which disadvantageously results in significant hydraulic losses. In order to avoid these actuation losses, the use of shift elements that can be actuated upon demand would be especially advantageous.

In order to make it possible to use shift elements that can be actuated upon demand, the shift elements, in particular the clutches, should be easily accessible from outside.

Shift elements that can be actuated upon demand may be understood, in particular, to be shift elements for maintaining the shift state, thus which use no energy or less energy, when disengaged or engaged, than when altering the shift state.

**SUMMARY OF THE INVENTION**

The object of the present invention is to propose a multi-stage transmission of the initially described type, which has

nine forward gears and a reverse gear having a sufficient transmission ratio, in which the design complexity, the component load and the installation size are optimized, and in which efficiency is improved. In addition, the shift elements of the transmission should be easily accessible from outside, which makes it possible to install shift elements that can be actuated upon demand. In addition, the transmission should be suitable for standard design and for a frontal transverse design.

Accordingly, a multi-stage transmission, according to the invention, of a planetary design is proposed which has an input shaft and an output shaft, which are disposed in a housing. In addition, there are provided at least four planetary gear sets which are designated, in the following, as the first, second, third, and fourth planetary gear sets, eight rotatable shafts which are designated, in the following, as the drive shaft, output shaft, third, fourth, fifth, sixth, seventh, and eighth shafts, and six shift elements, preferably designed as lamellar shift elements or as a form locking shift element, comprising brakes and clutches, whose selective engagement produces different transmission ratios between the drive shaft and the output shaft, and, therefore, preferably nine forward gears and one reverse gear can be implemented.

The planetary gear sets of the transmission are preferably designed as minus planetary gear sets.

As is well known, a simple minus planetary gear set comprises a sun gear, a ring gear, and a carrier on which the planetary gears are rotatably carried, the planetary gears meshing with the sun gear and the ring gear. As a result, when the carrier is fixed, the ring gear has a direction of rotation that is opposite that of the sun gear. In contrast, a simple plus planetary gear set comprises a sun gear, a ring gear and a carrier, on which inner and outer planet gears are rotatably carried, wherein all inner planet gears mesh with the sun gear and all outer planet gears mesh with the ring gear, and each inner planet gear meshes with only one outer planet gear. As a result, when the carrier is fixed, the ring gear has the same direction of rotation as the sun gear, and a positive stationary transmission ratio results.

According to the invention, the sun gear of the first planetary gear set is connected to the eighth shaft, which is connected to the sun gear of the second planetary gear set and which can be detachably connected, via a third clutch, to the drive shaft 1, wherein the drive shaft can be detachably connected, via a first clutch, to the fourth shaft, which is connected to the carrier of the first planetary gear set and which can be coupled, via a second brake, to the housing. In addition, the drive shaft can be detachably connected, via a second clutch, to the seventh shaft, which is connected to the carrier of the fourth planetary gear set and the ring gear of the third planetary gear set.

In addition, the sixth shaft is connected to the ring gear of the first planetary gear set, the carrier of the second planetary gear set and to the ring gear of the fourth planetary gear set, wherein the third shaft is connected to the sun gear of the third planetary gear set and the sun gear of the fourth planetary gear set, and can be coupled, via a first brake, to the housing.

In addition, the fifth shaft is connected to the ring gear of the second planetary gear set and can be coupled, via a third brake, to the housing, wherein the output shaft of the transmission is connected to the carrier of the third planetary gear set.

Because the first, second and third clutch are disposed on the drive shaft of the transmission and the remaining shift elements are designed as brakes, good accessibility of all the shift elements of the transmission is ensured, as a result of which the shift elements may be designed as shift elements

that can be actuated upon demand. Within the context of further embodiments, shift elements of the transmission may be designed, inter alia, as shift elements that can be hydraulically actuated.

In addition, transmission ratios are attained that are especially suitable for passenger vehicles, as well as a greater overall gear ratio of the multi-stage transmission, which results in improved driving comfort and a significant reduction in fuel consumption.

Furthermore, design complexity is significantly reduced with the multi-stage transmission, according to the invention, due to a low number of shift elements. Using the multi-stage transmission according to the invention, it is advantageously possible to perform a start-up using a hydrodynamic converter, an external start-up clutch, or any other suitable external start-up element. It is also conceivable to perform a start-up using a start-up element integrated in the transmission. Preferably, a shift element that is actuated in the first forward gear and in the reverse gear is suitable for this.

Moreover, the multi-stage transmission, according to the invention, results in good efficiency in the main drive gears with respect to drag losses and gearing losses.

Low torques are advantageously present in the shift elements and in the planetary gear sets of the multi-stage transmission, thereby advantageously reducing wear in the multi-stage transmission. In addition, the low torques make it possible to utilize correspondingly low dimensions, thereby reducing the necessary installation space and related costs. Furthermore, the rotational speeds of the shafts, shift elements, and planetary gear sets are low.

In addition, the transmission, according to the invention, is designed to allow adaptability to different drive train embodiments in terms of power flow direction and spatial aspects.

#### BRIEF DESCRIPTION OF THE DRAWINGS

The invention is described in greater detail in the following, as an example, with reference to the attached Figures. They show:

FIG. 1: a schematic view of a preferred embodiment of a multi-stage transmission according to the invention; and

FIG. 2: an example of a shift pattern for a multi-stage transmission according to FIG. 1.

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

FIG. 1 shows a multi-stage transmission, according to the invention, which has a drive shaft 1, an output shaft 2, and four planetary gear sets P1, P2, P3 and P4 which are disposed in a housing G. In the example shown in FIG. 1, planetary gear sets P1, P2, P3 P4 are designed as minus planetary gear sets. According to the invention, at least one of the planetary gear sets P1, P2, P3, P4 can be implemented as a plus planetary gear set if the carrier and ring gear connection are exchanged and, simultaneously, the value of the stationary transmission ratio is increased by 1 in comparison to the embodiment as a minus planetary gear set.

In the embodiment shown here, viewed axially, the planetary gear sets P1, P2, P3, P4 are disposed in the sequence of the first planetary gear set P1, the second planetary gear set P2, the third planetary gear set P3, the fourth planetary gear set P4. According to the invention, the axial sequence of the individual planetary gear sets and the configuration of the shift elements may be freely selected as long as this allows the elements to connect.

5

As shown in FIG. 1, six shift elements are provided, namely, three brakes, **03**, **04**, **05** and three clutches **14**, **17**, **18**. The spatial disposition of the shift elements can be arbitrary, and is limited only by the dimensions of the outer design. The clutches and the brakes of the transmission are preferably designed as friction elements or lamellar shift elements respectively; however they may also be designed as form-locking shift elements.

Selective shifting of nine forward gears and one reverse gear can be realized using these shift elements. The multi-stage transmission, according to the invention, has a total of eight rotatable shafts, namely, the shafts **1**, **2**, **3**, **4**, **5**, **6**, **7** and **8**, wherein the drive shaft forms the first shaft, and the output shaft forms the second shaft of the transmission.

According to the invention, in the multi-stage transmission according to FIG. 1 it is provided that the sun gear of the first planetary gear set **P1** is connected to the eighth shaft **8**, which is connected to the sun gear of the second planetary gear set **P2** and which can be detachably connected, via a third clutch **18**, to the drive shaft **1**, wherein the drive shaft **1** can be detachably connected, via a first clutch **14**, to the fourth shaft **4**, which is connected to the carrier of the first planetary gear set **P1** and which can be coupled, via a second brake **04**, to the housing **G**. With reference to FIG. 1, the drive shaft **1** can be detachably connected, via a second clutch **17**, to the seventh shaft **7**, which is connected to the carrier of the fourth planetary gear set **P4** and the ring gear of the third planetary gear set **P3**.

As is evident from FIG. 1, the sixth shaft **6** is connected to the ring gear of the first planetary gear set **P1**, the carrier of the second planetary gear set **P2** and the ring gear of the fourth planetary gear set **P4**, wherein the third shaft **3** is connected to the sun gear of the third planetary gear set **P3** and the sun gear of the fourth planetary gear set **P4**, and can be coupled, via a first brake **03**, to the housing **G**.

In addition, the fifth shaft **5** is connected to the ring gear of the second planetary gear set **P2** and can be coupled, via a third brake **05**, to the housing **G**, wherein the output shaft **2** of the transmission is connected to the carrier of the third planetary gear set **P3**.

In connection herewith, viewed axially, the first, second and third clutches **14**, **17**, **18** may be disposed side by side and may be designed as lamellar shift elements and have a common external disk carrier. In the embodiment shown, in particular the first brake **03** is suited for design as a dog clutch element, which significantly improves fuel consumption.

FIG. 2 shows an example of a shift pattern of a multi-stage transmission according to FIG. 1. Three shift elements are engaged for every gear. The shift pattern shows, as examples, the particular transmission ratios  $i$  of the individual gear steps and, to be determined therefrom, the gear increments or step changes  $\phi$  to the next higher gear, wherein the value 9.011 is the transmission ratio spread.

In the example shown, the values for the stationary transmission ratios of the planetary gear sets **P1**, **P2**, **P3**, **P4**, implemented as minus planetary gear sets, are—2.338, -1.600, -3.257 and -2.897 respectively. FIG. 2 shows that only one shift in element must be engaged and one shift element must be disengaged when shifting sequentially, since two neighboring gear steps jointly use two shift elements. It is also shown that a large transmission ratio spread is attained with small gear increments.

The first forward gear is attained by engaging the first and third brakes **03**, **05** and the third clutch **18**, the second forward gear is attained by engaging the first and third brakes **03**, **05** and the first clutch **14**, the third forward gear is attained by engaging the first brake **03** and the first and third clutches **14**,

6

**18**, the fourth forward gear is attained by engaging the first brake **03** and the second and third clutches **17**, **18**, the fifth forward gear, which is designed as a direct gear in the example shown, is attained by engaging the first, second and third clutches **14**, **17**, **18**, the sixth forward gear is attained by engaging the third brake **05** and the first and second clutches **14**, **17**, the seventh forward gear is attained by engaging the third brake **05** and the second and third clutches **17**, **18**, the eighth forward gear is attained by engaging the second and third brakes **04**, **05** and the second clutch **17** and the ninth forward gear is attained by engaging the second brake **04** and the second and third clutches **17**, **18**, wherein the reverse gear is attained by engaging the first and second brakes **03**, **04** and the third clutch **18**.

Alternatively, the fourth forward gear may be shifted by means of additional shift combinations, which are designated with an **M** in FIG. 2. Accordingly, the fourth forward gear can be attained by engaging the first and second brakes **03**, **04** and the second clutches **17**, or by engaging the first brake **03** and the first and second clutch **14**, **17**, or by engaging the first and third brakes **03**, **05** and the second clutch **17**.

Since the first, second and third brakes **03**, **04**, **05** and the third clutch **18** are engaged in the first forward gear and/or in the reverse gear, these shift elements can be used as start-up elements.

According to the invention, different gear increments also result from the same shift pattern depending on the shift logic, thereby making it possible to implement an application-specific or vehicle-specific variation.

According to the invention, it is also optionally possible to provide additional freewheels at each suitable location of the multi-staged transmission, for example, between a shaft and the housing, or possibly to connect two shafts.

An axle differential and/or a distributor differential can be disposed on the drive side or on the output side.

Within the scope of an advantageous development of the invention, the drive shaft **1** can be separated from a drive motor, as needed, by a clutch element, wherein a hydrodynamic converter, a hydraulic clutch, a dry start-up clutch, a wet start-up clutch, a magnetic powder clutch, or a centrifugal clutch or the like can be used as the clutch element. It is also possible to dispose such a start-up element in the power flow direction after the transmission wherein, in this case, the drive shaft **1** is permanently connected to the crankshaft of the drive motor.

The multi-stage transmission, according to the invention, also makes it possible to situate a torsional-vibration damper between the drive motor and the transmission.

Within the scope of a further, not depicted embodiment of the invention, a wear-free brake, for instance, a hydraulic or an electric retarder or the like, can be disposed on each shaft, preferably on the drive shaft **1** or the output shaft **2**, which is, in particular, of special significance for use in commercial vehicles. Furthermore, a power take-off drive can be provided on each shaft, preferably on the input shaft **1** or the output shaft **2**, for driving additional assemblies.

The friction shift elements that are used can be designed as power shiftable clutches or brakes. In particular, force locking clutches or brakes can be used, for instance, lamellar clutches, band brakes, and/or cone clutches.

A further advantage of the multi-stage transmission presented here is that an electric machine can be attached to each shaft as a generator and/or as an additional drive machine.

The invention claimed is:

1. A multi-stage transmission of a planetary design comprising:

a drive shaft (1),  
 an output shaft (2),

first, second, third and fourth planetary gear sets (P1, P2, P3, P4) disposed within a housing (G) and each of the first, the second, the third and the fourth planetary gear sets (P1, P2, P3, P4) comprising a sun gear, a ring gear and carrier,

rotatable third, fourth, fifth, sixth, seventh and eighth shafts (3, 4, 5, 6, 7, 8), and

six shift elements (03, 04, 05, 14, 17, 18), comprising first, second and third brakes (03, 04, 05) and first, second and third clutches (14, 17, 18), whose selective engagement produces different transmission ratios between the drive shaft (1) and the output shaft (2) so that nine forward gears and a reverse gear are implementable,

wherein the eighth shaft (8) is connected to both the sun gear of the first planetary gear set (P1) and the sun gear of the second planetary gear set (P2), and the eighth shaft (8) can be detachably connected, via a third clutch (18), to the drive shaft (1),

the drive shaft (1) is detachably connectable, via a first clutch (14), to the fourth shaft (4), the fourth shaft (4) is only directly connected to the carrier of the first planetary gear set (P1) and the fourth shaft (4) is couplable, via the second brake (04), to the housing (G),

the drive shaft (1) is detachably connectable, via a second clutch (17), to the seventh shaft (7), and the seventh shaft (7) is connected to both the carrier of the fourth planetary gear set (P4) and the ring gear of the third planetary gear set (P3),

the sixth shaft (6) is directly connected to each of the ring gear of the first planetary gear set (P1), the carrier of the second planetary gear set (P2) and the ring gear of the fourth planetary gear set (P4),

the third shaft (3) is connected to both the sun gear of the third planetary gear set (P3) and the sun gear of the fourth planetary gear set (P4), and the third shaft (3) can be coupled, via the first brake (03), to the housing (G), the fifth shaft (5) is connected to the ring gear of the second planetary gear set (P2) and is couplable, via the third brake (05), to the housing (G), and

the output shaft (2) is connected to the carrier of the third planetary gear set (P3).

2. The multi-stage transmission according to claim 1, wherein the first, the second, the third and the fourth planetary gear set (P1, P2, P3, P4) are designed as minus planetary gear sets.

3. The multi-stage transmission according to claim 1, wherein, when viewed axially, the first, the second, the third and the fourth planetary gear sets are disposed in a sequence of the first planetary gear set (P1), the second planetary gear set (P2), the third planetary gear set (P3) and the fourth planetary gear set (P4).

4. The multi-stage transmission according to claim 1, wherein the shift elements (03, 04, 05, 14, 17, 18) of the transmission are designed as shift elements that can be actuated upon demand.

5. The multi-stage transmission according to claim 1, wherein the first brake (03) is designed as a form-locking shift element.

6. The multi-stage transmission according to claim 1, wherein a first forward gear is attained by engaging the first and the third brakes (03, 05) and the third clutch (18),

a second forward gear is attained by engaging the first and the third brakes (03, 05) and the first clutch (14),

a third forward gear is attained by engaging the first brake (03) and the first and the third clutches (14, 18),

a fourth forward gear is attained by engaging the first brake (03) and the second and the third clutches (17, 18),

a fifth forward gear is attained by engaging the first, the second and the third clutches (14, 17, 18),

a sixth forward gear is attained by engaging the third brake (05) and the first and the second clutches (14, 17),

a seventh forward gear is attained by engaging the third brake (05) and the second and the third clutches (17, 18),

an eighth forward gear is attained by engaging the second and the third brakes (04, 05) and the second clutch (17),

a ninth forward gear is attained by engaging the second brake (04) and the second and the third clutches (17, 18), and

the reverse gear is attained by engaging the first and the second brakes (03, 04) and the third clutch (18).

7. The multi-stage transmission according to claim 1, wherein a first forward gear is attained by engaging the first and the third brakes (03, 05) and the third clutch (18),

a second forward gear is attained by engaging the first and the third brakes (03, 05) and the first clutch (14),

a third forward gear is attained by engaging the first brake (03) and the first and the third clutches (14, 18),

a fourth forward gear is attained by engaging the first and the second brakes (03, 04) and the second clutch (17),

a fifth forward gear is attained by engaging the first, the second and the third clutches (14, 17, 18),

a sixth forward gear is attained by engaging the third brake (05) and the first and the second clutches (14, 17),

a seventh forward gear is attained by engaging the third brake (05) and the second and the third clutches (17, 18),

an eighth forward gear is attained by engaging the second and the third brakes (04, 05) and the second clutch (17),

a ninth forward gear is attained by engaging the second brake (04) and the second and the third clutches (17, 18), and

the reverse gear is attained by engaging the first and the second brakes (03, 04) and the third clutch (18).

8. The multi-stage transmission according to claim 1, wherein a first forward gear is attained by engaging the first and the third brakes (03, 05) and the third clutch (18),

a second forward gear is attained by engaging the first and the third brakes (03, 05) and the first clutch (14),

9

a third forward gear is attained by engaging the first brake (03) and the first and the third clutches (14, 18),  
 a fourth forward gear is attained by engaging the first brake (03) and the first and the second clutches (14, 17),  
 a fifth forward gear is attained by engaging the first, the second and the third clutches (14, 17, 18),  
 a sixth forward gear is attained by engaging the third brake (05) and the first and the second clutches (14, 17),  
 a seventh forward gear is attained by engaging the third brake (05) and the second and the third clutches (17, 18),  
 an eighth forward gear is attained by engaging the second and the third brakes (04, 05) and the second clutch (17),  
 a ninth forward gear is attained by engaging the second brake (04) and the second and the third clutches (17, 18),  
 and  
 the reverse gear is attained by engaging the first and the second brakes (03, 04) and the third clutch (18).

9. The multi-stage transmission according to claim 1, wherein a first forward gear is attained by engaging the first and the third brakes (03, 05) and the third clutch (18),

a second forward gear is attained by engaging the first and the third brakes (03, 05) and the first clutch (14),  
 a third forward gear is attained by engaging the first brake (03) and the first and the third clutches (14, 18),  
 a fourth forward gear is attained by engaging the first and the third brakes (03, 05) and the second clutch (17),  
 a fifth forward gear is attained by engaging the first, the second and the third clutches (14, 17, 18),  
 a sixth forward gear is attained by engaging the third brake (05) and the first and the second clutches (14, 17),  
 a seventh forward gear is attained by engaging the third brake (05) and the second and the third clutches (17, 18),  
 an eighth forward gear is attained by engaging the second and the third brakes (04, 05) and the second clutch (17),  
 a ninth forward gear is attained by engaging the second brake (04) and the second and the third clutches (17, 18),  
 and  
 the reverse gear is attained by engaging the first and the second brakes (03, 04) and the third clutch (18).

10. The multi-stage transmission according to claim 1, wherein the multi-stage transmission is an automatic transmission for a motor vehicle.

11. A multi-stage transmission of a planetary design comprising:

a drive shaft,  
 an output shaft,  
 first, second, third and fourth planetary gear sets disposed within a housing, and each of the first, the second, the third and the fourth planetary gear sets comprising a sun gear, a carrier and a ring gear,  
 rotatable third, fourth, fifth, sixth, seventh and eighth shafts,  
 and  
 six shift elements, comprising first, second and third brakes and first, second and third clutches, whose selective engagement produces different transmission ratios between the drive shaft and the output shaft so that nine forward gears and a reverse gear are implementable,  
 wherein the eighth shaft is connected to both the sun gear of the first planetary gear set and the sun gear of the second planetary gear set, and the eighth shaft can be detachably connected, via a third clutch, to the drive shaft,  
 the drive shaft is detachably connectable, via a first clutch, to the fourth shaft, the fourth shaft is only directly connected to the carrier of the first planetary gear set and the fourth shaft is couplable, via the second brake, to the housing,

10

the drive shaft is detachably connectable, via a second clutch, to the seventh shaft, and the seventh shaft is connected to both the carrier of the fourth planetary gear set and the ring gear of the third planetary gear set,  
 the sixth shaft is directly, connected to each of the ring gear of the first planetary gear set, the carrier of the second planetary gear set and the ring gear of the fourth planetary gear set,  
 the third shaft is connected to both the sun gear of the third planetary gear set and the sun gear of the fourth planetary gear set, and the third shaft can be coupled, via the first brake, to the housing,  
 the fifth shaft is connected to the ring gear of the second planetary gear set and is couplable, via the third brake, to the housing, and  
 the output shaft is directly connected to the carrier of the third planetary gear set.

12. The multi-stage transmission according to claim 11, wherein a first forward gear is attained by engaging the first and the third brakes and the third clutch,

a second forward gear is attained by engaging the first and the third brakes and the first clutch,  
 a third forward gear is attained by engaging the first brake and the first and the third clutches,  
 a fourth forward gear is attained by engaging the first brake and the second and the third clutches,  
 a fifth forward gear is attained by engaging the first, the second and the third clutches,  
 a sixth forward gear is attained by engaging the third brake and the first and the second clutches,  
 a seventh forward gear is attained by engaging the third brake and the second and the third clutches,  
 an eighth forward gear is attained by engaging the second and the third brakes and the second clutch,  
 a ninth forward gear is attained by engaging the second brake and the second and the third clutches, and  
 the reverse gear is attained by engaging the first and the second brakes and the third clutch.

13. The multi-stage transmission according to claim 11, wherein a first forward gear is attained by engaging the first and the third brakes and the third clutch,

a second forward gear is attained by engaging the first and the third brakes and the first clutch,  
 a third forward gear is attained by engaging the first brake and the first and the third clutches,  
 a fourth forward gear is attained by engaging the first and the second brakes and the second clutch,  
 a fifth forward gear is attained by engaging the first, the second and the third clutches,  
 a sixth forward gear is attained by engaging the third brake and the first and the second clutches,  
 a seventh forward gear is attained by engaging the third brake and the second and the third clutches,  
 an eighth forward gear is attained by engaging the second and the third brakes and the second clutch,  
 a ninth forward gear is attained by engaging the second brake and the second and the third clutches, and  
 the reverse gear is attained by engaging the first and the second brakes and the third clutch.

14. The multi-stage transmission according to claim 11, wherein a first forward gear is attained by engaging the first and the third brakes and the third clutch,

a second forward gear is attained by engaging the first and the third brakes and the first clutch,  
 a third forward gear is attained by engaging the first brake and the first and the third clutches,

11

a fourth forward gear is attained by engaging the first brake and the first and the second clutches,  
a fifth forward gear is attained by engaging the first, the second and the third clutches,  
a sixth forward gear is attained by engaging the third brake and the first and the second clutches, 5  
a seventh forward gear is attained by engaging the third brake and the second and the third clutches,  
an eighth forward gear is attained by engaging the second and the third brakes and the second clutch, 10  
a ninth forward gear is attained by engaging the second brake and the second and the third clutches, and  
the reverse gear is attained by engaging the first and the second brakes and the third clutch. 15

15. The multi-stage transmission according to claim 11, wherein a first forward gear is attained by engaging the first and the third brakes and the third clutch,  
a second forward gear is attained by engaging the first and the third brakes and the first clutch,

12

a third forward gear is attained by engaging the first brake and the first and the third clutches,  
a fourth forward gear is attained by engaging the first and the third brakes and the second clutch,  
a fifth forward gear is attained by engaging the first, the second and the third clutches,  
a sixth forward gear is attained by engaging the third brake and the first and the second clutches,  
a seventh forward gear is attained by engaging the third brake and the second and the third clutches,  
an eighth forward gear is attained by engaging the second and the third brakes and the second clutch,  
a ninth forward gear is attained by engaging the second brake and the second and the third clutches, and  
the reverse gear is attained by engaging the first and the second brakes and the third clutch.

16. The multi-stage transmission according to claim 11, wherein the mufti-stage transmission is an automatic transmission for a motor vehicle.
